Department of Climate Change and
Meteorological Services

Period: 11 – 20 April 2017

Season: 2016/2017

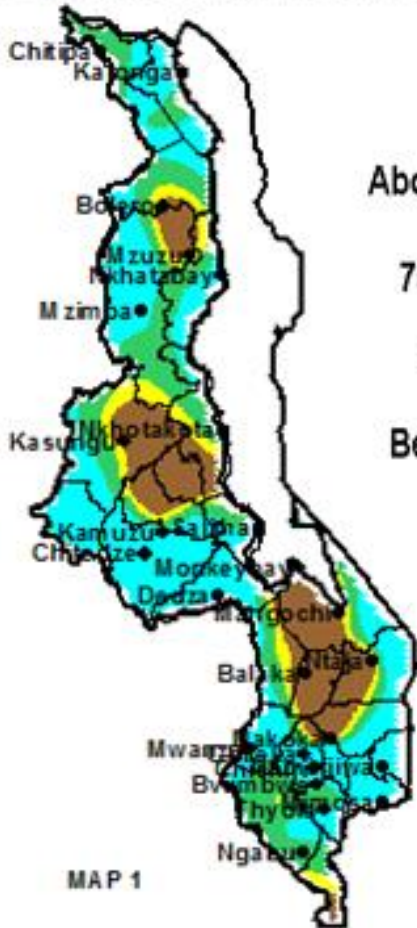

Issue No.20

Release date: 24 April 2017

HIGHLIGHTS

- Locally heavy rainfall persisted over highlands and northern lakeshore...
- Crops were mostly at drying and harvesting stages...
- Light to moderate rainfall expected during the period 21 to 30 April 2017...

10-DAY TOTAL RAINFALL FOR 11 - 20 APRIL 2017
AS A PERCENTAGE OF NORMAL RAINFALL

MAP 1

CUMULATIVE RAINFALL FROM 1 OCT 2016 TO 20 APRIL 2017
AS A PERCENTAGE OF NORMAL RAINFALL

MAP 2

Rainfall Maps for 11 to 20 April 2017

1.0 WEATHER SUMMARY

During the period 11 to 20 April 2017, Easterly waves had persisted over southern and central Malawi with equatorial rainfall belt still affecting northern parts of Malawi. As a result high rainfall amounts were reported mainly over highlands and along the Lakeshore areas (Green and light Blue colours on Map 1).

1.1 RAINFALL SITUATION

During the second ten days of April 2017, most areas in Malawi had recorded light to moderate rainfall amounts while heavy rainfall was confined mainly to a few highlands and along the Lakeshore areas. High cumulative rainfall amounts in excess of 100mm during the ten day period were reported at some stations including Chintheche Agric 259mm, Lujeri Tea Estate 219mm, Baka Research Station in Karonga had recorded 184mm, Nkhata Bay Met had 182mm, Vinthukutu Agric reported 157mm, Mulanje Agric had 130mm, Mimosa Met received 119mm and Karonga Met had reported 113mm. Other areas that had equally registered significant rainfall amounts included Chichiri Met 83mm, Dwangwa 81mm, Nathenje Agric 74mm, Nkhotakota Met 65mm, Chitedze Met 61mm, Mchinji Agric 57mm, Chelinda (Nyika) 55mm, Neno Agric 53mm and Euthini Agric 50mm. During the same period some parts of Mangochi, Machinga and Balaka districts in the south, Kasungu and Dowa in the centre and Mzimba in the north had registered nil rainfall throughout the period (Brown Colour on Map 1). Stations with nil rainfall included Kasungu Met, Malomo, Madisi, Mponela, Monkey Bay, Namiasi and Ntaja. More details are in Table 1.

Map 2 indicates the spatial cumulative rainfall distribution since the start of the 2016/17 rainfall season in October 2016, up to 20 April 2017. The map generally indicates that Malawi has received normal rainfall (Green colour) with portions of above normal rainfall (light Blue colour) and a few pockets of below normal rainfall (Yellow colour).

1.3 AIR TEMPERATURE

During the period 11 to 20 April 2017, warm to hot temperatures were observed over most parts of Malawi. Mean daily maximum temperatures had ranged from 23°C at Dedza to 32°C at Ngabu while the mean daily minimum temperatures had ranged from 15°C at Dedza to 22°C at Ngabu. During the same period the hottest temperature was 37°C recorded at Ngabu in Chikwawa. Details are in Table 2.

1.4 WIND SPEEDS

During the period 11 to 20 April 2017 most parts of Malawi had experienced light to moderate wind speeds. For instance, daily average wind speeds measured at a height of two metres above the ground level across the country had ranged from 1.8km per hour at Ngabu in Chikwawa district to 12.2km per hour at Chitipa. More details are in Table 2.

1.5 RELATIVE HUMIDITY

The daily average relative humidity values recorded from various weather stations in Malawi for the period 11 to 20 April 2017 show that air over Malawi was still fairly moist. Daily average relative humidity values had ranged from 61% at Mimosa in Mulanje district to 83% at Mkondezi in Nkhata Bay district. Details are on the Table 2.

1.6 SUNSHINE HOURS

Generally long hours of bright sunshine were observed along the lakeshore and cloudy conditions were confined to highlands during the second ten days of April 2017. The daily values had ranged from 4.5 hours at Mzuzu and 8.9 hours at Salima. For details see Table 2.

2. AGROMETEOROLOGICAL ASSESSMENT

The heavy rains that continued over the northern lakeshore areas during the second ten days of April 2017 have improved prospects for rice production particularly in Karonga and Nkhata Bay districts. These rains were also supportive to growth and development of roots and tuber crops. On the other hand, persistent wet weather had hindered harvesting and drying of matured crops and this is likely to increase losses of field crops.

Maize crop which is the staple food crop for Malawi was reported mostly at drying and harvesting stages. Harvesting of matured crops was in progress in most parts of Malawi. Reports also indicated that most farm families are having food from own production and this has improved household food security.

3. PROSPECTS FOR 2016/2017 RAINFALL SEASON

Climate models indicate that neutral conditions are likely to persist through April to June 2017. Neutral conditions mean that neither La Nina nor El Nino will be in effect. Therefore expect normal rainfall between May and June 2017.

4. OUTLOOK FOR 21 TO 30 APRIL 2017

Short to medium-term weather forecasts suggest that an influx of cool and moist south easterly air is likely to affect most parts of Malawi within the period 21 to 30 April 2017. Therefore expect light to moderate rainfall particularly over highlands and along northern lakeshore areas to continue during the forecast period.

Glossary of some terms on this table

- Eo = Potential Evaporation, Et = Potential Evapotranspiration and RH = Relative Humidity
- Mean Temperature of the day =(Max of the day + Min of the same day)/2
- ABS Max (Min) = Absolute Maximum (minimum) is the highest (lowest) of maximum (minimum) temperatures observed for a given number of days (calendar month) of a specified period of months (years).
- To convert Meters Per Second (mps) to Kilometres per hour (Km/hr) = mpsx3.6
